FDI IN FIGURES

April 2025

Modest growth in global FDI flows in 2024 masks weaker underlying trends

HIGHLIGHTS

- Global FDI flows were up by 1% in 2024, to USD 1 485 billion, but fell by 9% when excluding large fluctuations from selected European economies.
- Over half of OECD economies saw lower inflows, particularly in EU countries. FDI flows to G20 non-OECD economies also dropped by 30%. The People's Republic of China saw a continued decline for the third consecutive year.
- The United States, Luxembourg and Canada were the top three FDI destinations worldwide in 2024.
- Cross-border M&A activity is recovering slowly from a decade low, with advanced economies showing more resilience than emerging markets. Greenfield investment in 2024 showed weak momentum. Although project counts rose slightly by 2%, overall capital spending dropped by 6%.

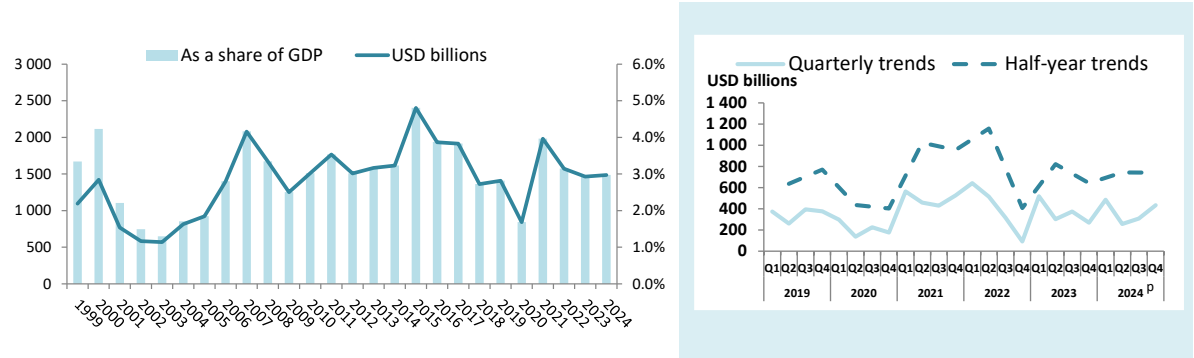
Find latest FDI data online

Detailed FDI statistics by partner country and by industry are available from **OECD's online FDI database** (see pre-defined queries). Find detailed information on inward and outward FDI flows, income and positions by main destination or source country, by industry sector, and for resident SPEs as well as information on inward FDI positions by ultimate investing country. Detailed data for 2023 are now available.

1 Recent developments

In 2024, global FDI flows were up 1% from 2023, to USD 1 485 billion (Figure 1).[1] However, when excluding large fluctuations in selected European economies, global FDI flows were down by 9%.[2]

Figure 1: Global FDI flows, 1999-2024



Source: *OECD International Direct Investment Statistics database.*

[1] By definition, inward and outward FDI worldwide should be equal but, in practice, there are statistical discrepancies between inward and outward FDI. Unless otherwise specified, references to 'global FDI flows' refer to the average of these two figures. The measure was constructed using FDI statistics on a directional basis whenever available, supplemented by data on an asset/liability basis when needed. See Notes for tables 1 to 3 on page 13 for details. Data are as of 15 April 2024

[2] Luxembourg, the Netherlands, and to a lesser extent Belgium, Ireland, Switzerland and the United Kingdom, often show large FDI fluctuations due to occasional major equity capital investment/disinvestment and/or intercompany loans, typically linked to large MNE groups re-organising their activities.

This decrease was felt in half the OECD economies and most emerging economies, mainly driven by movements in intra-company loans and in part by reduced FDI equity flows (Section 2). In a context of persistent geopolitical tensions, policy uncertainty and inflationary pressures affecting many economies, M&A activity and greenfield investment announcements resumed with difficulty in 2024 (Section 4). The outlook for 2025 remains unclear, as moderate global GDP growth is expected in the next two years, driven by rising trade barriers and shifting policy dynamics.

Inflows

Trends in FDI inflows in 2024 remain heavily influenced by large fluctuations in selected European economies (Figure 2). While overall, in **the OECD area**, FDI inflows rose by 2%, they actually declined by 7% when excluding these large fluctuations.[2] Over half of OECD economies saw lower inflows, particularly in EU countries. However, Canada and Australia recorded higher equity-driven inflows, likely linked to increased M&A activity, and the United States also reported increases, due to movements in intra-company loans and higher reinvestment of earnings (Figure 3).

In **the EU area**, FDI inflows almost doubled to USD 294 million in 2024, but excluding large fluctuations in selected economies, FDI flows fell by 24%. The drop was most notable in Germany, where German affiliates repaid loans to foreign parents while also issuing new ones to them. Poland saw reduced inflows due to intra-company loan movements and Spain reported equity disinvestments.

[3] Hong-Kong (China) and Singapore are not listed as major FDI sources and recipients, because it is thought that these economies are not the ultimate destinations or sources of a significant amount of their flows; instead, these flows pass through on their way to and from other economies.

[4] 'Other selected countries' recorded increases or decreases of more than USD 10 billion in their FDI inflows (Figure 3) or FDI outflows (Figure 5) between 2023-24

FDI flows in **G20 non-OECD** economies dropped by 30%. The People's Republic of China (hereafter 'China') saw a continued decline for the third consecutive year[5], and received less FDI than India and Indonesia (with Indonesia being the only G20 non-OECD economy to report an increase in FDI inflows). Argentina experienced sharp decreases too, due to movements of intra-company loans.

The United States remained the **top destination for FDI inflows** worldwide in 2024 (USD 308 billion), followed by Luxembourg (USD 106 billion) and Canada (USD 64 billion).[3]

Outflows

FDI outflows from **the OECD area** increased by 9% (Figure 4) but fell by 14% when excluding large fluctuations from the European countries. The United States experienced the largest drop in FDI outflows in the OECD (Figure 5), with foreign affiliates extending loans to their US parents. In contrast, Japan reported higher FDI outflows, mostly in the form of equity flows (Section 2).

In **the EU area**, FDI outflows almost tripled compared to 2023. However, when excluding volatile outflows from selected EU countries, they declined by 16%. The largest decreases within the EU were observed in France and Germany, due to movements in intra-company loans.

[5] See OECD (2024) FDI in Figures-April 2024, https://www.oecd.org/content/dam/oecd/en/topics/policy-sub-issues/fdi/FDI-in-Figures-April-2024.pdf/_jcr_content/renditions/original./FDI-in-Figures-April-2024.pdf

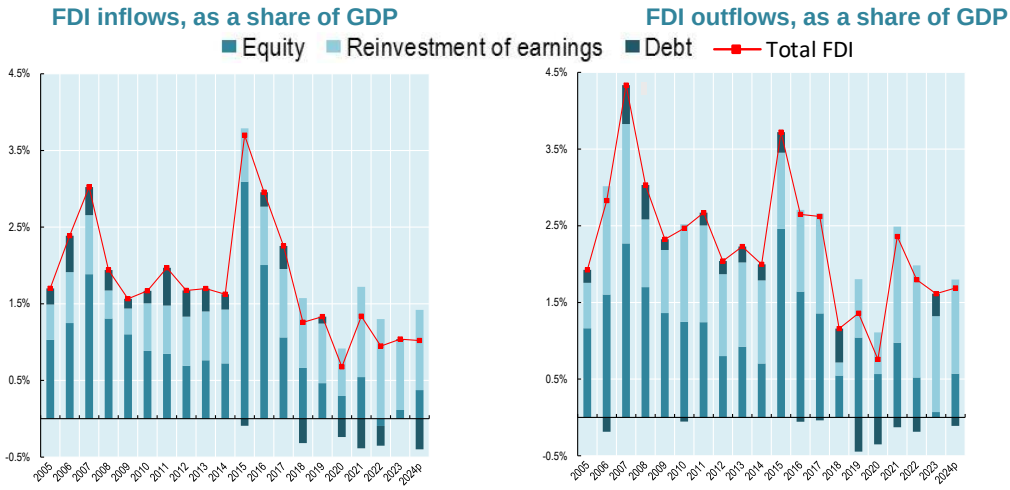
FDI outflows from **G20 non-OECD economies** dropped by 25% in 2024. The most significant declines were recorded in China and, to a lesser extent the Russian Federation, likely reflecting reduced new investment activity and, in the case of China, changes in intra-company loans.[6] Brazil also reported lower FDI outflows, as foreign affiliates increased lending to their Brazilian parents.

In 2024, the United States (USD 299 billion), Japan (USD 204 billion) and China (172 billion) were the **major sources of FDI outflows** worldwide.[3]

2 OECD equity capital FDI flows

In 2024, FDI equity flows in and from OECD countries increased substantially from low levels in 2023 (Figure 6).[7] However, FDI equity flows to OECD countries excluding the large fluctuations in selected European economies fell by 25% (Figure 6). The largest decreases were recorded in the United States, Spain and Italy (Figure 7). These decreases may not necessarily reflect a slowdown in new investment activity, in case this large investment may be offset by even larger disinvestment operations explaining the decrease in net equity flows. Overall, in 2024, Luxembourg was the main OECD recipient of FDI equity flows, at USD 133 billion, followed by the United States (USD 66 billion) and Canada (USD 42 billion).

Figure 6: OECD FDI flows by instruments, 2005-24



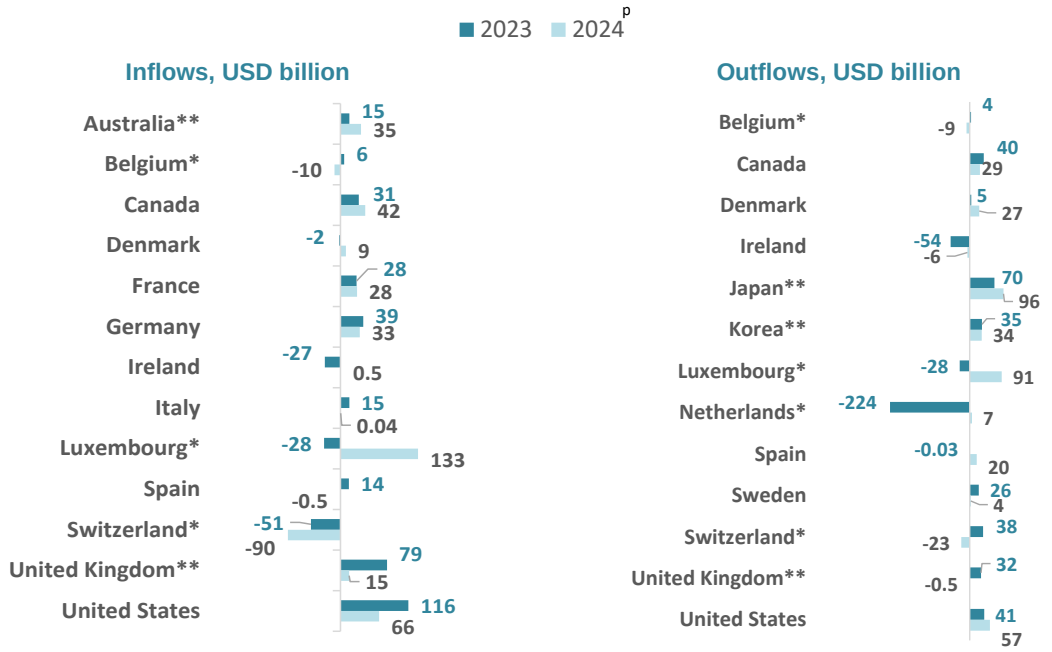
Notes: p: preliminary estimates. OECD FDI equity, reinvestment of earnings (RE) and debt flows are estimated using FDI instruments reported by OECD countries, on directional (DP) or asset/liability (AL) basis in accordance with FDI flows shown in Table 1. Non-reported FDI aggregates by instrument on DP basis were estimated using equity and RE reported on AL basis.
Source: *OECD International Direct Investment statistics database.*

FDI equity outflows from OECD countries excluding the large fluctuations in selected European countries grew by 18%. Among OECD countries, Japan and the United States reported the largest increase in FDI equity outflows, possibly reflecting increased new investment activity abroad. FDI equity outflows from Spain were also up from low levels in 2023, when Spanish investors had divested assets held in the Netherlands. Among OECD countries, Japan was the largest source of FDI equity outflows with USD 96 billion in 2024, followed by Luxembourg (USD 91 billion) and the United States (USD 57 billion).

[6] Official FDI flows statistics published by China and by the Russian Federation are available for equity and reinvestment of earnings combined, so it is not possible to analyse the trend of each component and their impact on the total FDI flows trend.

[7] Financial flows consist of three components: equity capital, reinvestment of earnings, and intracompany debt (see notes on page 12 for a description of each component). Equity capital is of particular interest because it often drives much of the volatility in FDI flows and because it is often associated with new investments, such as greenfield or M&As (discussed in Section 4). OECD FDI equity, reinvestment of earnings and debt flows are estimated using FDI instruments reported by OECD countries. See notes to Figure 6 for more detail.

Figure 7: FDI equity flows of selected OECD countries, 2023-24



Notes: Countries displayed in this chart either recorded more than USD 20 billion equity flows in 2024; or more than USD 10 billion increase or decrease in FDI equity flows between 2023 and 2024. * Data exclude resident SPEs. **Asset/liability basis.

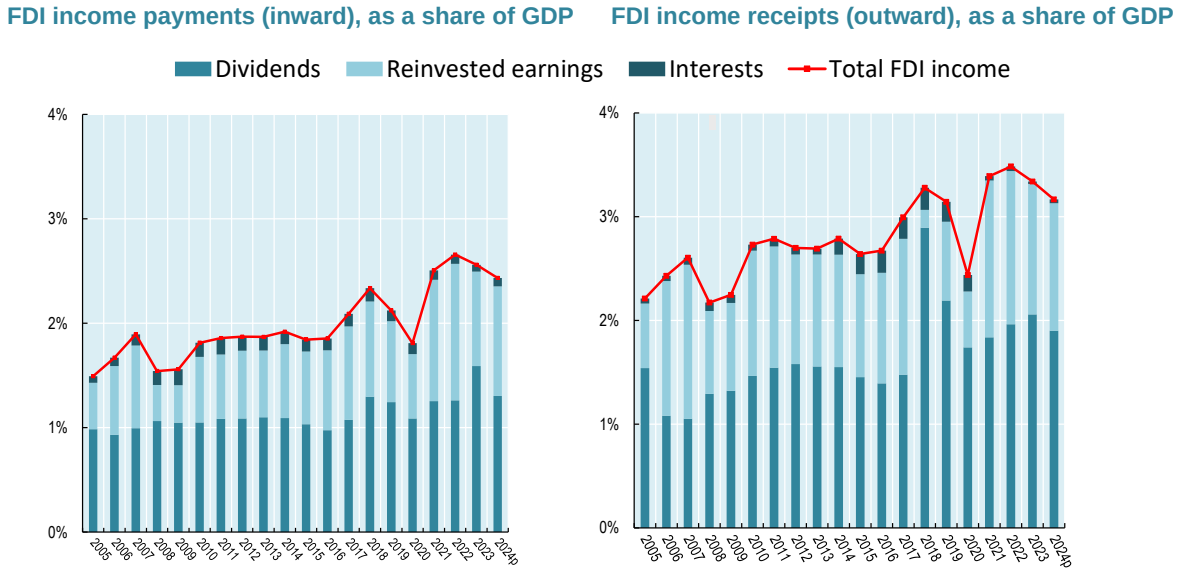
3 Recent trends in FDI income of OECD countries

FDI income consists of a foreign investor's share in the earnings of its affiliates and net interest from intercompany debt. Changes in earnings reflect changes in profitability of the investment. Earnings are further broken down into dividends and reinvested earnings. FDI income and its components are estimated using data reported by OECD countries.[8] **In 2024, FDI income payments and receipts in the OECD area continued on a downward trend,** accounting for 2.4% and 3.2% of the OECD area's GDP, respectively (Figure 8).

FDI earnings payable by affiliates located in OECD economies (i.e., OECD earnings on inward FDI) **dropped by 2% compared to 2023.** In 2024, dividend payments were down by 14% whereas reinvested earnings went up by 21%. Foreign affiliates located in the United States, the Netherlands and Ireland were the largest sources of OECD FDI earnings payable (Figure 9). **FDI earnings receivable by parents located in OECD economies** (i.e., OECD earnings on outward FDI) **fell by 1% in 2024.** Dividends dropped by 4% but reinvested earnings increased by 2%. Parents in the United States remained by far the largest recipient of OECD FDI earnings receivable.

[8] See notes to Figure 8 for more detail. Interest is not discussed separately since it tends to be a small share of total income.

Figure 8: OECD FDI income by components, 2005-24



Notes: p: preliminary estimates. OECD FDI dividends, reinvested earnings and interest are estimated using FDI income components reported by OECD countries, on directional basis (DP) or asset/liability basis (A/L) in accordance with total FDI income shown in Table 3. Non reported FDI income aggregates by component on DP basis were estimated using dividends and RE reported on AL basis. Non-reported FDI income components were estimated using RE reported for FDI flows and by distributing dividends and interests equally or by distributing total FDI income equally among the three components.

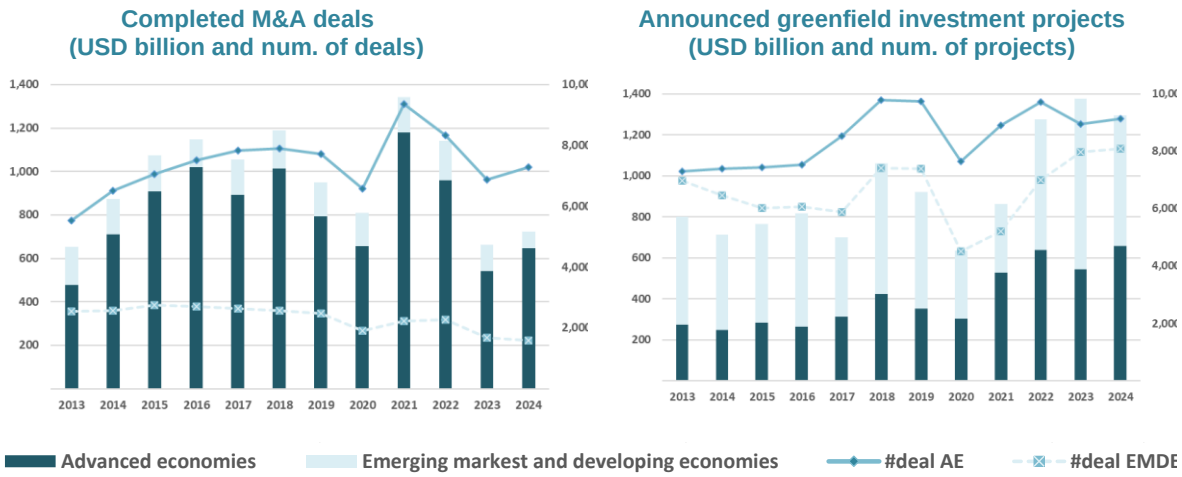
4 Cross-border M&A and announced greenfield projects

Equity capital flows in official FDI statistics are closely tied to new investment, regardless of the mode of entry (cross-border M&A and greenfield investment) and divestment by foreign direct investors. **In 2024, cross-border M&A activity from the Refinitiv database resumed with difficulty,** in a context of persistent geopolitical tensions, policy uncertainty and inflationary pressures affecting many economies.[9] Deal values were up by only 9% from a decade low and the number of concluded deals grew even more modestly, by 4%. **This slow recovery in cross-border M&A activity was driven by a rebound in advanced economies (AEs), while the slowdown persisted in emerging markets and developing economies (EMDEs).** Deal values and the number of concluded deals in AEs were up by 20% and 6%, respectively, while in EMDEs they dropped by a further 38% and 6%, respectively (Figure 10).

The three largest deals concluded in 2024 targeted Italy, Australia and the United States. Those deals as observed in Refinitiv are: the acquisition of NetCo, the primary and backbone fixed-line network business of Telecom Italia SpA (Italy), a telecommunication company, by an investor group led by Kohlberg Kravis Roberts &Co (United States), for USD 24 billion; the acquisition of AirTrunk Operating Pty Ltd (Australia), a provider of data processing and hosting services, by an investor group led by Blackstone Inc. (United States), for USD 16 billion; and the merger between NFP Corp (United States), an insurance agency, with Aon PLC (Ireland), a provider of professional services, for USD 14 billion. Altogether, these three deals accounted for 8% of the overall value of all completed deals in 2024. **Cross-border deal making activity was concentrated,** with over half deal values in 2024 involving just five target economies (United States, United Kingdom, Canada, Germany and Australia). The top five (ultimate) investing economies (United States, United Kingdom, Canada, Japan and France) accounted for 54% of all deal values in 2024.

The rebound in AEs was driven by the industrial and financial sectors, with concluded deal values increasing by 64% and 24%, respectively. In contrast, most other sectors recorded declines, especially basic materials (-68%), professional services (-50%) and technology (-29%).

Figure 10. Cross-border investment activity, 2013-24*



Note: * The number of deals or announced projects is reported on the left-hand-side scale. 'Advanced economies' and 'Emerging and developing economies' follow the IMF definitions.
Source: Refinitiv and FT fDI Market databases, OECD calculations.

[9] For a more comprehensive evaluation of the macroeconomic environment see OECD (2025), OECD Economic Outlook, Interim Report March 2025: Steering through Uncertainty, OECD Publishing, Paris, https://doi.org/10.1787/89af4857-en.

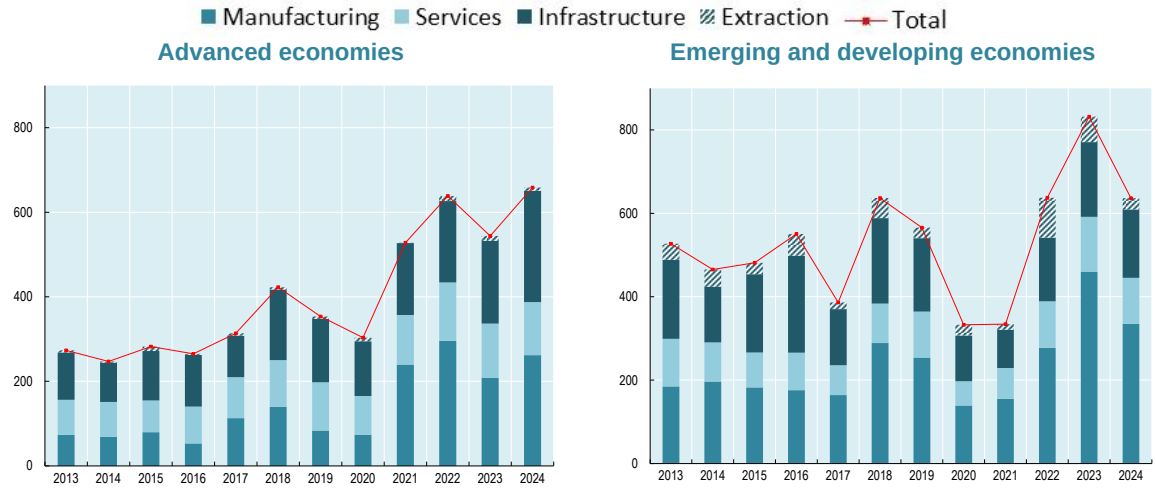
Prospects for 2025 remain uncertain, as moderate global GDP growth is expected in the next two years with higher trade barriers and increased policy. In the first quarter of 2025, deal values and the number of concluded deals fell by about 27% and 18%, respectively, compared to the last quarter of 2024. Nevertheless, when compared to their levels a year earlier (i.e., in Q1 2024), fewer deals were concluded but deal values remained stable.

Announced greenfield investment (GI) projects from the Financial Times fDI markets database in 2024 showed weak momentum (Figure 10). While the number of announced projects grew marginally by 2% in both AEs and EMDEs, capital expenditure declined overall by 6%. Much of the drop (24%) was felt by EMDEs, affecting all sectors, but especially extractive activities (down by 56%). Capital expenditure rose by 21% in AEs, with the largest increases in infrastructure (+34%) and manufacturing (+26%).

Despite the overall decline in EMDEs, a major project (of USD 30 billion) was announced in the manufacturing sector to build liquefied gas plants in Argentina. A series of renewable energy projects in Egypt were also announced, totalling USD 16 billion. In AEs, the rebound was partly driven by two major announced projects (of around USD 25 billion each) to build production facilities for semiconductors and other electronic components in the United States.

Greenfield investment in 2024 was also highly concentrated, with 40% of total capital expenditure targeting five economies (United States, India, United Kingdom, Egypt and Brazil); and the top five (immediate) investing economies (United States, China, Japan, United Kingdom, and United Arab Emirates) making up 41% of the total.

Figure 11. Announced greenfield projects by sector, 2019-24 (USD billion)



Notes: This chart represents announced capital expenditures by sector, in USD billion. 'Advanced economies' and 'Emerging and developing economies' are defined as per the IMF definition.

Notes for Tables 1 to 3

Data are updated as of 15 April 2025.

p: preliminary data |: break in series
(A): asset/liability figure used for specific years only

Tables 1, 2 and 3 show FDI statistics at the aggregate level on a directional basis except for selected countries for which the asset/liability series is used (see note 2). For more information on the two presentations for FDI, see Asset/liability versus directional presentation. FDI terms are defined in the FDI Glossary.

Financial flows consist of three components: equity capital, reinvestment of earnings, and intra-company debt. Equity capital is often associated with new investments, such as greenfield or M&As, even though it can also reflect extensions of capital or financial restructuring. Nevertheless, equity capital flows are often taken as a sign of the amount of new investments related to FDI. Reinvestment of earnings is the portion of earnings that the parent decides to reinvest in the affiliate rather than receive as a dividend and can be an important source of financing for affiliates. This component of financial flows tends to be the least volatile. Changes in the reinvestment of earnings reflect both changes in the earnings of affiliates and in the amount of earnings that parents choose to distribute. The reinvestment ratio is the share of earnings that the parent reinvests. It can be an indication of the parent's perception of investment opportunities available to the affiliate: if the parent sees the opportunity to make profitable investments in its affiliates, the parent might choose to reinvest more money in them. However, many other factors can influence the share of earnings reinvested. For example, if the parent is in need of cash, they might pay higher dividends. The third component of financial flows—intra-company debt–is the most volatile component of financial flows and is often driven by the short term financing needs within a company rather than larger overall macroeconomic phenomena. As such, intra-company debt is often the most difficult aspect of financial flows to explain. **FDI financial transactions may result in negative flows for three reasons**. First, if there is disinvestment in assets—that is, the direct investor sells its interest in a direct investment enterprise to a third party or back to the direct investment enterprise. Second, if the parent borrowed money from its affiliate or if the affiliate paid off a loan from its direct investor. Third, if reinvested earnings are negative. Reinvested earnings are negative if the affiliate loses money or if the dividends paid out to the direct investor are greater than the income recorded in that period.

Direct investment income is part of the return on the direct investment position; that is, the return on equity and debt investment. **FDI income payments** measure the total returns within a year on direct investment stocks paid by enterprises in the reporting economy to their foreign investors. **FDI income receipts** measure the total returns within a year on direct investment stocks received by investors in the reporting economy from their direct investment enterprises abroad.

Breaks in series were introduced in Table 1 and Table 3 to provide users with more complete historical series on FDI financial and income flows. These breaks in series correspond for most countries to the implementation of OECD Benchmark Edition 4th Edition (BMD4).

For data going back to 2005 in Tables 1, 2 and 3 (in Excel format), see www.oecd.org/investment/statistics.htm.

1. **OECD, European Union, EU27 (excluding the United Kingdom), World, G20 aggregates**:

   FDI outward and inward flows (Table 1) were compiled using directional figures when available. Missing quarterly directional figures were approximated using the ratio between annual asset liability and directional figures; or by distributing annual directional figures equally among the four quarters; or using unrevised historical data. When directional figures were not available and could not be approximated, asset liability figures were used.

   FDI outward and inward stocks (Table 2) and Income on inward and outward FDI (Table 3) were compiled using directional figures when available. Missing directional figures were approximated using unrevised historical data. When directional figures were not available and could not be approximated, asset liability figures were used. FDI positions for 2023 include positions at end-2022 when 2023 data are not available.

   Resident SPEs from Austria, Belgium (except FDI income), Chile, Denmark, Hungary, Iceland, Korea (FDI positions only), Latvia, Luxembourg, Mexico, the Netherlands, Norway (FDI positions only), Portugal, Spain (FDI positions only), Sweden (FDI positions only) and Switzerland are excluded.

   The European Union aggregate corresponds to member country composition of the reporting period: EU15 for data up to and including 2003, EU25 for data between 2004 and 2006, EU27 for data between 2007 and 2012, EU28 starting from 2013 and EU27 (excluding the United Kingdom) starting from 2020.

2. **Data series on asset/liability basis:** The data series is on an asset/liability basis as opposed to directional basis for Australia, Colombia, Israel, Korea, Norway and for the following non-OECD countries: Argentina, China, India, Saudi Arabia and South Africa.

3. **World aggregate**: is based on available data at the time of update as reported to the OECD and IMF. Missing data for countries for Q3 and Q4 2024 were estimated using the overall growth rate observed between, respectively, Q2 and Q3 2024 and Q3 and Q4 2024. Growth rates were calculated from data for OECD countries, for non-OECD G20 countries, and for 50 non-OECD and non-G20 countries in Q3 and 15 non-OECD and non-G20 countries in Q4. World totals for FDI positions are based on available FDI data at the time of update as reported to OECD and IMF for the year ended or the latest available year. By definition, inward and outward FDI worldwide should be equal. However, in practice, there are statistical discrepancies between inward and outward FDI. Unless otherwise specified, references to "global FDI flows" refer to the average of these two figures.

4. **Special purpose entities (SPEs)**: Information on resident SPEs for Estonia and Sweden (FDI flows only) is confidential. This information is not yet available separately for Canada, Chile, Costa Rica, Japan and Mexico. The information is available separately for Austria, Belgium, Denmark, Finland, Hungary, Iceland, Ireland, Korea, Latvia, Luxembourg, the Netherlands, Norway, Poland, Portugal, Spain, Sweden, Switzerland, the United Kingdom and the United States. However, the information is not displayed in the tables for all countries, due to confidentiality restrictions, limited availability of historical data or to differences in data vintages. Resident SPEs are not present or not significant in Australia, the Czech Republic, France, Germany, Greece, Israel, Italy, New Zealand, the Slovak Republic, Slovenia and Türkiye.

5. The statistical data for Israel are supplied by and under the responsibility of the relevant Israeli authorities. The use of such data by the OECD is without prejudice to the status of the Golan Heights, East Jerusalem and Israeli settlements in the West Bank under the terms of international law.

6. Data for 2024 for Saudi Arabia was not available at the time of writing.

FDI in Figures is published twice yearly. For queries, please contact **investment@oecd.org**. Find data and more detailed FDI statistics at **www.oecd.org/investment/statistics.htm**. To receive news and e-alerts about OECD work on international investment, follow the subscription procedure at **www.oecd.org/investment/investmentnews.htm**.
